

Tele-Erection System

Concrete Structure Unmanned Construction System

Hazard

Earthquake Land Slide Cyclone Volcano

Solution Purpose

Response Recovery

Solution Theme

Disaster Prevention Plan Infrastructure Technology

Technology Subject

Plan for Relief & Recovery Support Dam & Reservoir Road

Advantages

A system for constructing concrete structures such as erosion control dams by piling up freestanding formwork blocks as the main body of the structure and pouring concrete on the back of the formwork by remote control from a remote control room in a dangerous area where no one can enter.

Solution Illustrated

✘ Fujita was one of the first companies to incorporate high-technology, including communication and video technology, into the construction industry to promote automation and labor saving in construction work. This technology was applied to the unmanned construction for stone removal work at

Unzen Fugen-dake. Furthermore, we developed an unmanned construction system (Tele-Erection System) for concrete structures, which requires high construction accuracy.

Setting up blocks

Placing of concretes

Overall view of completed block setting

Background

This system is a technology that enables the construction of concrete structures by remote control, even in hazardous areas that are inaccessible to humans.

Exposition of the Solution

1. Ultra-long-range operation possible

Ultra-remote operation is possible in a control room located about 2 km away from the installation site.

2. Shorter construction period and cost reduction possible

Shorter construction period and cost reduction possible

3. Standard Block shape

The standard block shape is 1 m high, 1 m wide, and 0.9m deep, with a weight of 2.06tf/piece.

4. Block shape

The block shape can be changed according to the application.

Achievements of Examples

- Stone removal work at Unzen Fugendake (1994)
- Verification experiment of unmanned construction technology for concrete structures (1996) and other results available
